RESEARCH REPORT: RR 25741
(CSI # 03151)

BASED UPON ICC ES EVALUATION
REPORT NO. ESR-2713

REEVALUATION DUE DATE

December 1, 2011

Issued Date: November 1, 2009

Code: 2008 LABC

GENERAL APPROVAL – Reevaluation - Titen HD® Screw Anchor for Cracked and Un-cracked Concrete.

DETAILS

The above assemblies and/or products are approved when in compliance with the description, use, identification and findings of ICC Evaluation Services Report No.ESR-2713, dated September 1, 2008, revised June 2009, of the ICC Evaluation Service, Incorporated. The report in its entirety is attached and made part of this general approval.

The parts of Report No.ESR-2713 which are excluded on the attached copy have been removed by the Los Angeles Building as not being included in this approval.

The approval is subject to the following conditions:

1. The allowable and strength design values listed in the attached report and tables are for the fasteners only. Connected members shall be checked for there capacity (which may govern).
2. The anchors shall be identified by labels on the packaging indicating the manufacturer's name and product designation.
3. The anchors shall be installed as per the attached manufacturer's instructions except as otherwise stated in this report. Copies of the installation instructions shall be available at each job site.

RR 25741

Simpson Strong-Tie Co., Inc.

Re: Titen HD® Screw Anchor for Cracked and Uncracked Concrete

4. Design values and minimum embedment requirements shall be per Tables in ICC ES Report No. ESR-2713. (As modified by the City of Los Angeles).
5. Anchor spacing and edge distance, as well as minimum member thickness, must comply with Tables 1 and 4, and Figures 2, 3 and 4, of the attached ESR-2713 and with Table 1911.2 of the 2008 Los Angeles City Building Code.
6. Special inspection in accordance with Section 91.1704 of the 2008 Los Angeles City Building Code shall be provided for anchor installations.
7. Anchors may be installed at embedment less than minimum depth per Table 1911.2 of the 2008 Los Angeles City Building Code for the following conditions:
 - a. Anchors are limited to the installation of Plumbing/fire sprinkler system, HVAC and electrical conduit.
 - b. 10 percent of the bolts are field load tested after installation. The bolt shall develop 300 percent of the allowable capacities listed in tables 5 through 13. If a Failure occurs, then test 25% of the bolts.
8. The use of anchors is limited to dry, interior locations.
9. Calculations demonstrating that the applied loads or factored loads are less than the allowable load values or design strength level values respectively, described in this report shall be submitted to the plan check Engineer at the time of permit application. The calculations shall be prepared by a Civil or Structural Engineer registered in the State of California.

Simpson Strong-Tie Co., Inc.

Re: Titen HD® Screw Anchor for Cracked and Uncracked Concrete

DISCUSSION:

The report is in compliance with 2008 Los Angeles Building Code.

The approval is based on tests in accordance with ICC-ES Acceptance Criteria for Mechanical Anchors in Concrete Elements (AC193), dated May 2008.

The allowable loads are limited to Table 1911.2 of the 2008 LABC for anchors embedded in concrete. The anchors have been tested in accordance with ACI 355.2-04 and AC193 for static and dynamic loads.

This general approval will remain effective provided the Evaluation Report is maintained valid and unrevised with the issuing organization. Any revisions to this report must be submitted to this Department, with appropriate fee, for review in order to continue the approval of the revised report.

Addresses to whom this Research Report is issued is responsible for providing copies of it, complete with any attachments indicated, to architects, engineers and builders using items approved herein in design or construction which must be approved by Department of Building and Safety Engineers and Inspectors.

This general approval of an equivalent alternate to the Code is only valid where an engineer and/or inspector of this Department has determined that all conditions of this approval have been met in the project in which it is to be used.

Simpson Strong-Tie offers software to assist in the design of anchorages using Simpson Strong-Tie products. The software "Anchor Designer for ACI-318" includes selectable Strength Design methodology utilizing ICC-ES AC193-compliant data to generate designs in conformance with the 2008 Los Angeles City Building Code.

EVALUATION SUBJECT:
TITEN HD® SCREW ANCHOR FOR CRACKED AND UNCRACKED CONCRETE
1.0 EVALUATION SCOPE
Compliance with the following codes:

- 2006 *International Building Code*® (2006 IBC)
- * ■ ~~2006 *International Residential Code*® (2006 IRC)~~
- ~~2003 *International Building Code*® (2003 IBC)~~
- ~~2003 *International Residential Code*® (2003 IRC)~~
- ~~1997 *Uniform Building Code*™ (UBC)~~

Property evaluated:

Structural

2.0 USES

The Simpson Strong-Tie Titen HD® Screw Anchor is used to resist static, wind and seismic tension and shear loads in cracked and uncracked normal-weight concrete and structural sand-lightweight concrete members having a specified compressive strength, f'_c , from 2,500 psi to 8,500 psi (17.2 MPa to 58.6 MPa); and cracked and uncracked structural sand-lightweight or normal-weight concrete over profile steel deck having a minimum specified compressive strength, f'_c , of 3,000 psi (20.7 MPa).

- The Titen HD® is an alternative to cast-in-place anchors described in Sections 1911 and 1912 of the 2006 IBC, ~~Sections 1912 and 1913 of the 2003 IBC, and Sections 1923.1 and 1923.2 of the UBC. The anchors may also be used where an engineering design is submitted in accordance with Section R301.1.3 of the 2006 and 2003 IRC.~~

3.0 DESCRIPTION
3.1 Titen HD®:

The Titen HD® screw anchor is a carbon steel threaded anchor with a hex-washer head. The screw anchor is manufactured from heat-treated steel complying with SAE J403 Grade 10B21, and has an electrodeposited coating of zinc in accordance with ASTM B 633, SC1, Type III. Titen HD® screw anchors are available with nominally $\frac{3}{8}$ -, $\frac{1}{2}$ -, and $\frac{3}{4}$ -inch (9.5, 12.7, and 19.1 mm) shank diameters, and various lengths in each diameter. Figure 1 illustrates a typical Titen HD® screw anchor.

3.2 Concrete:

- Normal-weight and structural sand-lightweight concrete must comply with Sections 1903 and 1905 of the IBC ~~or UBC, as applicable.~~

3.3 Profile Steel Deck:

The profile steel deck must comply with the configuration in Figures 3 and 4 and have a minimum base steel thickness of 0.034 inch (0.864 mm). Steel must comply with ASTM A 653/A 653M SS Grade 40, and have a minimum yield strength of 40,000 ksi (276 MPa).

4.0 DESIGN AND INSTALLATION
4.1 Strength Design:

- Anchor design strengths, ϕN_n and ϕV_n , must be determined in accordance with ACI 318-05 Appendix D using the design parameters provided in Tables 2, 3 and 4 and in Figures 2, 3, and 4 of this report. The anchor design must satisfy the requirements in ACI 318 D.4.1.1 and D.4.1.2. The value of f'_c used in the calculations must be limited to 8,000 psi (55.2 MPa), maximum, in accordance with ACI 318 D.3.5. Strength reduction factors, ϕ , described in ACI 318 Section D.4.4 and noted in Tables 2 and 3 of this report, must be used for load combinations calculated in accordance with Section 1605.2.1 of the IBC, ~~Section 9.2 of ACI 318, or Section 1612.2.1 of the UBC.~~ Strength reduction factors, ϕ , described in ACI 318 Section D.4.5, must be used for load combinations calculated in accordance with ACI 318 Appendix C ~~or Section 1909.2 of the UBC.~~

4.1.1 Static Steel Strength in Tension: The nominal steel strength of a single screw anchor in tension, N_{sa} , calculated in accordance with ACI 318 D.5.1.2, is given in Table 2 of this report. The strength reduction factor, ϕ , corresponding to a brittle steel element must be used for all anchors, as described in Table 2.

*Revised June 2009

4.1.2 Static Concrete Breakout Strength in Tension:

The nominal concrete breakout strength of a single screw anchor or a group of screw anchors in tension, N_{cb} or N_{cbg} , must be calculated in accordance with ACI 318 D.5.2, with modifications as described in this section. The basic concrete breakout strength of a single screw anchor in tension in cracked concrete, N_b , must be calculated in accordance with ACI 318 D.5.2.2 using the values of h_{ef} and k_c as described in Table 2 of this report. The modification factors in ACI 318 D.5.2.4, D.5.2.5, D.5.2.6, and D.5.2.7 must be applied to the concrete breakout strength as applicable.

Determination of concrete breakout strength in accordance with ACI 318 D.5.2 is not required for anchors installed in the lower flute or upper flute of the soffit of profile steel deck floor and roof assemblies with structural sand-lightweight or normal-weight concrete fill as shown in Figure 3 or Figure 4, respectively.

4.1.3 Static Pullout Strength in Tension: The nominal pullout strength of a single screw anchor in tension satisfying ACI 318 D.5.3.1 and D.5.3.2 in cracked and uncracked concrete, $N_{pn,cr}$ and $N_{pn,uncr}$, respectively, is described in Table 2 of this report. $N_{pn,cr}$ and $N_{pn,uncr}$ must be used in lieu of N_{pn} . In regions of a concrete member where analysis indicates no cracking at service level loads in accordance with ACI 318 D.5.3.6, the nominal pullout strength in uncracked concrete, $N_{pn,uncr}$, applies. Where values for $N_{pn,cr}$ or $N_{pn,uncr}$ are not provided in Table 2, the pullout strength does not need to be considered in design.

The nominal pullout strength in cracked concrete for anchors installed in the lower flute or upper flute of the soffit of structural sand-lightweight or normal-weight concrete filled profile steel deck floor and roof assemblies, $N_{pn,deck,cr}$, as shown in Figures 3 and 4, is given in Table 4. $N_{pn,deck,cr}$ must be used in lieu of $N_{pn,cr}$. In regions of a concrete member where analysis indicates no cracking in accordance with ACI 318 D.5.3.6, the nominal pullout strength in uncracked concrete $N_{pn,deck,uncr}$ applies in lieu of $N_{pn,uncr}$. The value of $\Psi_{c,p}$ is 1.0 for all cases.

4.1.4 Static Steel Strength in Shear: The nominal steel strength in shear, V_{sa} , of a single screw anchor in accordance with ACI 318 D.6.1.2, is given in Table 3 of this report. The strength reduction factor, ϕ , corresponding to a brittle steel element must be used for all anchors, as described in Table 3.

The nominal shear strength, $V_{st,deck}$, of a single screw anchor installed in the lower flute or upper flute of the soffit of structural sand-lightweight or normal-weight concrete filled profile steel deck floor and roof assemblies, as shown in Figures 3 and 4, is given in Table 4.

4.1.5 Static Concrete Breakout Strength in Shear: The nominal concrete breakout strength in shear of a single screw anchor or group of screw anchors, V_{cb} and V_{cbg} , respectively, must be calculated in accordance with ACI 318 D.6.2, with modifications as described in this section. The basic concrete breakout strength in shear of a single screw anchor in cracked concrete, V_b , must be calculated in accordance with ACI 318 D.6.2.2 using the values of l_e and d_o as described in Table 3 of this report. The modification factors in ACI 318 D.6.2.4, D.6.2.5, D.6.2.6 and D.6.2.7 must be applied to the basic breakout strength as applicable.

Calculation of the concrete breakout strength in accordance with ACI 318 D.6.2 is not required for screw anchors installed in the lower flute or upper flute of the soffit of structural sand-lightweight or normal-weight concrete filled profile steel deck floor and roof assemblies, as shown in Figures 3 and 4.

4.1.6 Static Concrete Pryout Strength in Shear: The nominal concrete pryout strength for a single screw anchor or group of screw anchors, V_{cp} and V_{cpg} , respectively, must be calculated in accordance with ACI 318 D.6.3, modified by using the value of coefficient for pryout strength, k_{cp} , described in Table 3 of this report and the value of nominal breakout strength in tension of a single screw anchor or group screw anchors, N_{cb} or N_{cbg} , as calculated in Section 4.1.2 of this report.

For anchors installed in the lower flute or upper flute of the soffit of structural sand-lightweight or normal-weight concrete filled profile steel deck floor and roof assemblies, as shown in Figure 3 or Figure 4, respectively, calculation of the concrete pryout strength in accordance with ACI 318 D.6.3 is not required.

4.1.7 Requirements for Seismic Design:

4.1.7.1 General: When the screw anchor design includes seismic loads, the additional requirements of ACI 318 D.3.3 must apply, as modified by Section 1908.1.16 of the 2006 IBC, ~~or the following for legacy codes:~~

CODE	ACI 318 D.3.3 SEISMIC REGION	CODE EQUIVALENT DESIGNATION
2003-IBC & IRC	Moderate or high seismic risk	Seismic Design Categories C, D, E and F
UBC	Moderate or high seismic risk	Seismic Zones 2B, 3 and 4

* Except for use in Seismic Design Category A or B of the IBC ~~or Seismic Zone 0, 1 or 2A of the UBC~~, design strengths must be determined presuming the concrete is cracked.

As the screw anchors include brittle steel elements, the screw anchors and attachments must be designed in accordance with ACI 318 D.3.3.5 as modified by Section 1908.1.16 of the 2006 IBC for locations in Seismic Design * Category C, D, E or F (IBC) ~~or Seismic Zone 2B, 3 or 4 (UBC)~~.

4.1.7.2 Seismic Tension: The nominal steel strength and concrete breakout strength in tension must be determined in accordance with ACI 318 D.5.1 and D.5.2, as described in Sections 4.1.1 and 4.1.2 of this report. In accordance with ACI 318 D.5.3.2, the appropriate value for nominal pullout strength in tension for seismic loads, $N_{pn,eq}$ or $N_{pn,deck,cr}$, described in Tables 2 and 4 of this report, must be used in lieu of N_{pn} .

4.1.7.3 Seismic Shear: The nominal concrete breakout and concrete pryout strength in shear must be determined in accordance with ACI 318 D.6.2 and D.6.3, as described in Sections 4.1.5 and 4.1.6 of this report. In accordance with ACI 318 D.6.1.2, the appropriate value for nominal steel strength in shear for seismic loads, $V_{sa,eq}$ or $V_{st,deck}$, described in Tables 3 and 4 of this report, must be used in lieu of V_{sa} .

4.1.8 Interaction of Tensile and Shear Forces: Screw anchors or groups of screw anchors that are subjected to combined axial (tensile) and shear loadings must be designed in accordance with ACI 318 D.7.

4.1.9 Requirements for Minimum Member Thickness, Minimum Anchor Spacing and Minimum Edge Distance: In lieu of ACI 318 D.8.3, values of c_{min} and s_{min} provided in Table 1 of this report must be used. In lieu of ACI 318 D.8.5, minimum member thickness, h_{min} , must comply with Table 1 of this report. In lieu of ACI 318 D.8.6, values of c_{ac} provided in Table 1 must be used. For anchors installed in the lower flute or upper flute of the

soffit of structural sand-lightweight or normal-weight concrete filled profile steel deck floor and roof assemblies, details in Figures 3 and 4 must be observed. The minimum anchor spacing along the flute must be the greater of 3.0 h_{ef} or 1.5 times the flute width.

4.1.10 Structural Sand-lightweight Concrete: Where structural sand-lightweight concrete is used, in lieu of ACI 318 D.3.4, the values determined in Sections 4.1.2, 4.1.3, 4.1.5, 4.1.6 and 4.1.7 of this report must be multiplied by 0.60 and utilized. For anchors installed in the lower flute or upper flute of the soffit of structural sand-lightweight concrete filled profile steel deck floor and roof assemblies, this reduction is not required.

4.2 Allowable Stress Design (ASD):

4.2.1 General: Design values for use with allowable stress design load combinations calculated in accordance with Sections 1605.3 of the IBC ~~and Section 1612.3 of the UBC~~, must be established using the following relationships:

$$T_{allowable,ASD} = \Phi N_n / \alpha$$

and

$$V_{allowable,ASD} = \Phi V_n / \alpha$$

where:

$$T_{allowable,ASD} = \text{Allowable tension load, lbf (N)}$$

$$V_{allowable,ASD} = \text{Allowable shear load, lbf (N)}$$

ΦN_n = The lowest design strength of an anchor or anchor group in tension as determined in accordance with ACI 318 Appendix D, Section 4.1 of this report, and 2006 IBC Section 1908.1.16, as applicable (lbf or N).

ΦV_n = The lowest design strength of an anchor or anchor group in shear as determined in accordance with ACI 318 Appendix D, Section 4.1 of this report, and 2006 IBC Section 1908.1.16, as applicable (lbf or N).

α = A conversion factor calculated as a weighted average of the load factors for the controlling load combination. In addition, α must include all applicable factors to account for nonductile failure modes and required over-strength.

An example calculation for the derivation of allowable stress design tension values is presented in Table 5.

The requirements for member thickness, edge distance and spacing, described in Table 1 of this report, must apply.

4.2.2 Interaction of Tensile and Shear Forces: The interaction of tension and shear loads must be consistent with ACI 318 D.7, as follows:

If $T_{applied} \leq 0.2T_{allowable,ASD}$, then the full allowable strength in shear, $V_{allowable,ASD}$, must be permitted.

If $V_{applied} \leq 0.2V_{allowable,ASD}$, then the full allowable strength in tension, $T_{allowable,ASD}$, must be permitted.

For all other cases: $T_{applied} / T_{allowable,ASD} + V_{applied} / V_{allowable,ASD} \leq 1.2$.

4.3 Installation:

Installation parameters are provided in Table 1 and Figures 2, 3, and 4. Anchor locations must comply with this report and the plans and specifications approved by the code official. The Titen HD[®] must be installed in accordance with the manufacturer's published instructions and this report.

Anchors must be installed by drilling a pilot hole into the concrete using a handheld electro-pneumatic rotary hammer drill with a carbide-tipped drill bit conforming to ANSI B212.15-1994. The pilot hole must have the same diameter as the nominal diameter of the anchor. The hole is drilled to the specified nominal embedment depth plus ½ inch (12.7 mm). Dust and debris in the hole must be removed by using oil-free compressed air. The Titen HD[®] screw anchors must be installed into the hole to the specified embedment depth using a socket wrench or powered impact wrench. The maximum installation torque and maximum impact wrench torque rating requirements for the Titen HD[®] screw anchor are detailed in Table 1.

For anchors installed in the lower flute or upper flute of the soffit of structural sand-lightweight or normal-weight concrete over profile steel deck floor and roof assemblies, the hole diameter in the steel deck must not exceed the diameter of the hole in the concrete by more than ¼ inch (3.2 mm).

4.4 Special Inspection:

Installations must be made under special inspection in accordance with Section 1704.13 of the IBC ~~and Section 1701.5.2 of the UBC~~. The special inspector must be on the jobsite continuously during anchor installation to verify anchor type, anchor dimensions, hole cleanliness, embedment depth, concrete type, concrete compressive strength, drill bit diameter, hole depth, edge distance(s), anchor spacing(s), concrete thickness, installation torque, and maximum impact wrench torque rating.

Under the IBC, additional requirements as set forth in Section 1705 or 1706 must be observed.

5.0 CONDITIONS OF USE

The Simpson Strong-Tie Titen HD[®] Screw Anchors described in this report comply with, or are suitable alternatives to what is specified in, those codes listed in Section 1.0 of this report, subject to the following conditions:

- 5.1** The anchors must be installed in accordance with the manufacturer's published installation instructions and this report. In case of conflict, this report governs.
- 5.2** Anchor sizes, dimensions and minimum embedment depths are set forth in the tables of this report.
- 5.3** The anchor must be installed in accordance with Section 5.1 of this report in cracked and uncracked normal-weight and structural sand-lightweight concrete having a compressive strength, f'_c , of 2,500 psi to 8,500 psi (17.2 MPa to 58.6 MPa); and cracked and uncracked structural sand-lightweight or normal-weight concrete over profile steel deck having a minimum specified compressive strength, f'_c , of 3,000 psi (20.7 MPa).
- 5.4** The value of f'_c used for calculation purposes must not exceed 8,000 psi (55.2 MPa).
- 5.5** Strength design values must be established in accordance with Section 4.1 of this report.
- 5.6** Allowable stress design values must be established in accordance with Section 4.2 of this report.
- 5.7** Anchor spacing and edge distance, as well as minimum member thickness, must comply with Tables 1 and 4, and Figures 3 and 4, of this report.

- 5.8** Prior to installation, calculations and details demonstrating compliance with this report must be submitted to the code official. The calculations and details must be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed.
- 5.9** Since an ICC-ES acceptance criteria for evaluating data to determine the performance of screw anchors subjected to fatigue or shock loading is unavailable at this time, the use of these anchors under such conditions is beyond the scope of this report.
- 5.10** Anchors may be installed in regions of concrete where cracking has occurred or where analysis indicates cracking may occur, subject to the conditions of this report.
- 5.11** Anchors may be used to resist short-term loading due to wind or seismic forces, subject to the conditions of this report.
- 5.12** Anchors are not permitted to support fire-resistance-rated construction. Where not otherwise prohibited by the code, Titen HD[®] anchors are permitted for installation in fire-resistance-rated construction provided that at least one of the following conditions is fulfilled:
- Anchors are used to resist wind or seismic forces only.
 - Anchors that support gravity load-bearing structural elements are within a fire-resistance-rated envelope for a fire-resistance-rated

membrane, are protected by approved fire-resistance-rated materials, or have been evaluated for resistance to fire exposure in accordance with recognized standards.

- Anchors are used to support nonstructural elements.

- 5.13** Use of anchors is limited to dry, interior locations.
- 5.14** Special inspection must be provided in accordance with Section 4.4.
- 5.15** The anchors are manufactured by Simpson Strong-Tie Company, Inc., in Brampton, Ontario, Canada, under a quality control program with inspections by CEL Consulting (AA-639.)

6.0 EVIDENCE SUBMITTED

Data in accordance with the ICC-ES Acceptance Criteria for Mechanical Anchors in Concrete Elements (AC193), dated May 2008, including optional suitability test for seismic tension and shear; profile steel deck soffit tests; mechanical properties tests; calculations; and a quality control manual.

7.0 IDENTIFICATION

The Titen HD[®] Screw Anchor packaging is marked with the Simpson Strong-Tie Company name; product name (Titen HD[®]); anchor diameter and length; the name or logo of the inspection agency (CEL Consulting); and the evaluation report number (ESR-2713). In addition, the ≠ symbol and the anchor length (in inches) are stamped on the head of the each screw anchor.

Strength Reduction Factor - Pullout Failure ⁵	ϕ_p	-	0.65					
Tension Strength for Seismic Applications (ACI 318 D.3.3.3)								
Nominal Pullout Strength for Seismic Loads ($f'_c=2,500$ psi)	$N_{pn,eq}$	lbf.	1,235 ⁶	2,700 ⁶	N/A ⁴	N/A ⁴	6,070 ⁶	7,195 ⁶
Strength Reduction Factor - Breakout or Pullout Failure ⁵	ϕ_{eq}	-	0.65					

For SI: 1 inch = 25.4mm, 1 lbf = 4.45N.

¹The information presented in this table is to be used in conjunction with the design criteria of ACI 318 Appendix D.

* ²The tabulated value of ϕ_{sa} applies when the load combinations of Section 1605.2.1 of the IBC, ~~Section 1612.2.1 of the UBC~~, or ACI 318 9.2 are used. If the load combinations of ~~Section 1909.2 of the UBC~~ or ACI 318 Appendix C are used, the appropriate value of ϕ must be determined in accordance with ACI 318 D.4.5(b).

* ³The tabulated values of ϕ_{cb} applies when both the load combinations of Section 1605.2.1 of the IBC, ~~Section 1612.2.1 of the UBC~~, or ACI 318 Section 9.2 are used and the requirements of ACI 318 D.4.4(c) for Condition B are met. If the load combinations of ~~Section 1909.2 of the UBC~~ or ACI 318 Appendix C are used, the appropriate value of ϕ must be determined in accordance with ACI 318 D.4.5(c) for Condition B.

⁴As described in this report, N/A denotes that pullout resistance does not govern and does not need to be considered.

* ⁵The tabulated values of ϕ_p or ϕ_{eq} applies when both the load combination of ACI 318 Section 9.2, IBC Section 1605.2.1 ~~or UBC Section 1612.2.1~~ are used and the requirements of ACI 318 D.4.4(c) for Condition B are met. If the load combinations of ACI 318 Appendix C ~~or UBC Section 1909.2~~ are used, the appropriate value of ϕ must be determined in accordance with ACI 318 D.4.5(c) for Condition B.

⁶The characteristic pullout resistance for greater compressive strengths maybe increased by multiplying the tabular value by $(f'_c/2,500)^{1/2}$ for psi or $(f'_c/17.2)^{1/2}$ for MPa.

TABLE 3—TITEN HD® SHEAR STRENGTH DESIGN DATA¹

CHARACTERISTIC	SYMBOL	UNITS	NOMINAL ANCHOR DIAMETER					
			3/8 inch		1/2 inch		3/4 inch	
Anchor Category	1, 2 or 3		1					
Embedment Depth	h_{nom}	in.	2 1/2	3 1/4	3 1/4	4	5 1/2	6 1/4
Steel Strength in Shear (ACI Section D.6.1)								
Shear Resistance of Steel	V_{sa}	lbf.	4,460		7,455		16,840	
Strength Reduction Factor - Steel Failure ²	ϕ_{sa}	-	0.60					
Concrete Breakout Strength in Shear (ACI 318 D.6.2)								
Nominal Diameter	d_o	in.	0.375		0.500		0.750	
Load Bearing Length of Anchor in Shear	l_e	in.	1.77	2.40	2.35	2.99	4.22	4.86
Strength Reduction Factor - Concrete Breakout Failure ³	ϕ_{cb}	-	0.70					
Concrete Pryout Strength in Shear (ACI 318 D.6.3)								
Coefficient for Pryout Strength	k_{cp}	-	1.0			2.0		
Strength Reduction Factor - Concrete Pryout Failure ⁴	ϕ_{cp}	-	0.70					
Shear Strength for Seismic Applications (ACI 318 D.3.3.3)								
Shear Resistance of Single Anchor for Seismic Loads ($f'_c=2,500$ psi)	$V_{sa,eq}$	lbf.	2,855		4,790		9,350	
Strength Reduction Factor - Steel Failure ²	ϕ_{eq}	-	0.60					

For SI: 1 inch = 25.4mm, 1 lbf = 4.45N.

- ¹The information presented in this table is to be used in conjunction with the design criteria of ACI 318 Appendix D.
- * ²The tabulated value of ϕ_{sa} and ϕ_{eq} applies when the load combinations of Section 1605.2.1 of the IBC, ~~Section 1612.2.1 of the UBC~~, or ACI 318 9.2 are used. If the load combinations of ~~Section 1909.2 of the UBC~~ or ACI 318 Appendix C are used, the appropriate value of ϕ must be determined in accordance with ACI 318 D.4.5 (b).
- * ³The tabulated value ϕ_{cb} of applies when both the load combinations of Section 1605.2.1 of the IBC, ~~Section 1612.2.1 of the UBC~~, or ACI 318 Section 9.2 are used and the requirements of ACI 318 D.4.4(c) for Condition B are met. If the load combinations of ~~Section 1909.2 of the UBC~~ or ACI 318 Appendix C are used, the appropriate value of ϕ must be determined in accordance with ACI 318 D.4.5(c) for Condition B.
- * ⁴The tabulated values of ϕ_{cp} applies when both the load combinations of ACI 318 Section 9.2, IBC Section 1605.2.1, ~~or UBC Section 1612.2.1~~ are used and the requirements of ACI 318 D.4.4(c) for Condition B are met. If the load combinations of ACI 318 Appendix C ~~or UBC Section 1907.2~~ are used, the appropriate value of ϕ must be determined in accordance with ACI 318 D.4.5(c) for Condition B.

TABLE 4—TITEN HD® TENSION AND SHEAR DESIGN DATA FOR THE SOFFIT OF CONCRETE-FILLED PROFILE STEEL DECK ASSEMBLIES¹

CHARACTERISTIC	SYMBOL	UNITS	LOWER FLUTE				UPPER FLUTE	
			ANCHOR DIAMETER				ANCHOR DIAMETER	
			¾ inch		½ inch		¾ inch	½ inch
Minimum Hole Depth	h_{hole}	in.	2	3	2½	4	2	2½
Embedment Depth	h_{nom}	in.	1½	2½	2	3½	1½	2
Effective Embedment Depth	h_{ef}	in.	0.92	1.77	1.29	2.56	0.92	1.29
Pullout Resistance, concrete on metal deck (cracked) ²	$N_{pn,deck,cr}$							
		lbf.	580	1,335	905	2,040	765	1,700
Pullout Resistance, concrete on metal deck (uncracked) ³	$N_{pn,deck,unscr}$	lbf.	825	1,905	1,295	2,910	1,095	2,430
Steel Strength in Shear, concrete on metal deck ⁴	$V_{st,deck}$	lbf.	2,240	2,395	2,435	4,430	4,180	7,145

For SI: 1 inch = 25.4 mm, 1 lbf = 4.45N.

¹Installation must comply with Section 3.3, 4.1.9 and 4.3 and Figures 3 and 4 of this report.

²The tabulated values must be used in accordance with Section 4.1.3 and 4.1.7.2 of this report.

³The tabulated values must be used in accordance with Section 4.1.3 of this report.

⁴The tabulated values must be used in accordance with Section 4.1.3 and 4.1.7.3 of this report.

TABLE 5—EXAMPLE TITEN HD® ALLOWABLE STRESS DESIGN TENSION VALUES FOR ILLUSTRATIVE PURPOSES

Nominal Anchor Diameter, d, (inches)	Embedment Depth, h_{nom} (inches)	Effective Embedment Depth, h_{ef} (inches)	Allowable Tension Load, $\phi N_r/\alpha$ (lbs)**
¾	2½	1.77	1,185
	3¼	2.40	1,960
½	3¼	2.35	1,900
	4	2.99	2,725
¾	5½	4.22	4,570
	6¼	4.86	5,645

Design Assumptions:

1. Single Anchor
2. Tension load only
3. Concrete determined to remain uncracked for the life of the anchorage
4. Load combinations from ACI 318 section 9.2 (no seismic loading)
5. 30 percent dead load (D) and 70 percent live load (L); Controlling load combination is $1.2D + 1.6L$
6. Calculation of α based on weighted average: $\alpha = 1.2D + 1.6L = 1.2 (0.3) + 1.6 (0.7) = 1.48$
7. Normal weight concrete: $f'_c = 2,500$ psi
8. $C_{a1} = C_{a2} \geq C_{ac}$
9. $h \geq h_{min}$
10. Values are for Condition B (Supplementary reinforcement in accordance with ACI 318 D.4.4 is not provided).

**** Illustrative Procedure (reference Table 2 of this report):**

Titen HD®, ¾ inch diameter, with an effective embedment, $h_{ef} = 1.77$ "

Step 1: Calculate static steel strength in tension ACI 318 D.5.1 = $\phi_{sa} N_{sa} = 0.65 \times 10,890 = 7,078$ lbs.

Step 2: Calculate static concrete breakout strength in tension in accordance with ACI 318 D.5.2 = $\phi_{cb} N_{cb} = 0.65 \times 2,826 = 1,837$ lbs.

Step 3: Calculate static pullout strength in tension in accordance with ACI 318 D.5.3 = $\phi_p N_{pn,unscr} = 0.65 \times 2,700 = 1,755$ lbs.

Step 4: The controlling value (from Steps 1, 2 and 3 above) in accordance with ACI 318 D.4.1.2 = $\phi N_r = 1,755$ lbs.

Step 5: Divide the controlling value by the conversion factor in accordance with Section 4.2.1 of this report:

$$T_{allowable,ASD} = \phi N_r / \alpha = 1,755 / 1.48 = 1,185 \text{ lbs.}$$
